The design documentation for the pet adoption application showcases a comprehensive mobile-responsive interface structured through a high-contrast white, dark gray, and orange color palette. The user journey begins with onboarding and authentication screens for splash sequences, login, and registration. This leads to a discovery feed utilizing a grid-based layout for browsing pets, organized by species icons. Detailed pet views include large hero images, descriptive text, and primary orange action buttons to initiate the adoption process. The adoption workflow is managed through multi-step application forms designed for user data and inquiries, supported by a dedicated chat and messaging UI for direct communication with shelters. Finally, a user profile and activity section provides screens for managing favorites, account settings, and application history, all accessible via a consistent bottom navigation bar.
